

When I need prewiring service?

The alarm system should be set up with qualified installers, still you can diy it in your own house. In that case , if not confident enough that you could connect with the right terminal strips/choose the correct resistors, please consider using prewiring service.

How does the prewiring service work?

First, we will discuss what parts are included in your system. Like how many PIR sensors/reed switches/other detectors , is there IP module/Radio receiver/remotes? Then we will do the programming as you request to ensure all the parts work properly.

Next, we will make sure you wire all the parts up without any mistake. We'll use **short cables (15cm roughly)** to connect them together, and ship to you as a whole. When it's time for the installation, cut those short cables in the middle, use 4 core security cable to extend them. Please make sure the power is off (not connect to AC or Battery) when you touch the board or connect wires. Or you can replace those short cables with proper length cables, same wire goes to the same terminal strip.

How much does the service cost?

For standard Alarm kit with 3 PIR sensors, it would be \$65. Adding each one more sensor will be \$15 extra charge, adding other module like IP module/receiver may cost extra \$10. Please note this service comes with free online support/troubleshooting via text/phone/facetime if having any problem during installation.
